Uniform Solution Proposal Requirements

The following proposal structure applies uniformly to every challenge. Applicants should provide enough detail for the proposal to be assessed on problem fit, solution quality, technical feasibility, development readiness, innovation and team capability. Keep the proposal focused on solution development; pilot validation is addressed only after the development plan.

Proposal component	What the applicant should provide
1. Problem understanding & user workflow	Explain the problem, users/beneficiaries and current workflow. Identify the specific gap(s) addressed and the intended outcome.
2. Proposed solution & key features	Describe the solution, main modules/functions, user interaction and what changes versus the current approach.
3. User journey, wireframes & prototype	Provide user-flow/process diagrams and key screen wireframes/mock-ups. Show prototype/demo maturity where available.
4. Technology & solution architecture	Describe stack and architecture: software/hardware, AI/ML models or algorithms, methods/rules, APIs/integrations, data flow and hosting.
5. Development methodology & intermediate steps	Show the sequence from discovery/requirements through design, prototype, MVP, testing and refinement, with key outputs.
6. Development timeline & milestones	Provide an indicative development timeline with phases, milestones, deliverables and dependencies, including when the solution will be ready for validation.
7. Data & information requirements	Specify data/information needed for development and testing, formats, processing/annotation needs, dependencies and assumptions. Do not assume unconfirmed access.
8. Team, manpower & expertise	Identify roles, relevant domain/technical expertise and indicative manpower by development phase. Highlight critical specialist skills.
9. Testing, validation & evidence	Explain development testing, proposed performance/quality measures and evidence of progress. Include relevant prior research, pilots, deployments or product evidence.
10. Security, privacy, safety & compliance	Identify relevant security, privacy, safety, regulatory, interoperability, auditability and human-review requirements and how they will be addressed.
11. Innovation & differentiation	Explain the novel element, relevant existing alternatives/prior art and the basis of differentiation. Mention relevant IP and key open-source/proprietary dependencies.
12. Resources, risks & pilot validation	Provide indicative development/validation resource and cost drivers, key risks and mitigations. Briefly state how the developed solution would subsequently be pilot-validated in the stated context.

Assessment dimensions: problem relevance and understanding; solution completeness and user fit; technical soundness; feasibility and development plan; innovation/differentiation; data, security and compliance; team/domain capability; validation evidence; resource realism; and pilot-validation readiness.
